In the claims:

1. (currently amended) An integrated actuator for an optical switch mirror array used in optical communication systems, said integrated actuator comprising:

means for applying a <u>non-electromagnetic</u> tilting <u>push</u> force to a mirror, against an underside thereof and against a fin extending from said underside for developing an initial tilt position of said mirror as it rotates about a torsion beam,

said tilting force application means comprising a gas blast apparatus providing said tilting push force as a pulse; and

means for applying a <u>an electromagnetic</u> pull-in force to complete the tilt of said mirror to its final optical switching position beyond said initial tilt position in the mirror array.

- 3. (deleted)
- 4. (deleted)
- 5. (original) The actuator of claim 1 wherein said means for applying a pull-in force comprises an electrostatic generator for generating an electrostatic force.
- 6. (original) The actuator of claim 1 wherein said means for applying a pull-in force comprises a magnetic generator for generating a magnetic force.

- 7. (original) The actuator of claim 1 wherein said means for applying a pull-in force comprises a combination of electrostatic and magnetic generators for generating a combined electrostatic and magnetic force.
- 8. (original) The actuator of claim 1 wherein said fin extends from said underside of said mirror in substantially perpendicular fashion.
- 9. (original) The actuator of claim 1 wherein said fin extends from said underside of said mirror in an inclined fashion, to enhance and prolong the effect of the blast.
- 10. (original) The actuator of claim 1 further comprising a plurality of fins extending from said underside of said mirror in combined perpendicular and inclined fashion.
- 11. (currently amended) A combined actuator for an optical switch mirror array used in optical communication systems, said integrated actuator comprising a combined actuation mechanism based upon a pulsed gas flow providing a mechanical, non-electromagnetic tilting push force and an electrostatic pull-in force.
- 12. (currently amended) A combined actuator for an optical switch mirror array used in optical communication systems, said integrated actuator comprising a combined actuation mechanism based upon a pulsed gas flow providing a mechanical, non-electromagnetic tilting push force and a magnetic generator providing a magnetic pull-in force.

(currently amended) A method of actuating a micro-mirror in an optical switch mirror array used in optical communication systems, said method comprising:

applying a mechanical, non-electromagnetic tilting push force to bring the mirror to a tilted position, and

applying at least one of an electrostatic and magnetic force to achieve pull-in to complete the tilt of the mirror to its final optical switching position,

said tilting push force application being performed by a gas blast apparatus providing said tilting push force as a pulse.

(currently amended) A method of actuating a micro-mirror in an optical switch mirror array used in optical communication systems, said method comprising:

applying a mechanical, non-electromagnetic tilting push force to bring the mirror to a tilted position, and

applying a combination of an electrostatic and magnetic force to achieve pull-in to complete the tilt of the mirror to its final optical switching position,

said tilting push force application being performed by a gas blast apparatus providing said tilting push force as a pulse.

(original) The method of claim 14 wherein said combined electrostatic and magnetic force achieve pull-in to complete the tilt of the mirror to its final optical switching position, and wherein said magnetic force ensures latching in said final position, even if there is a power failure.
